

PA-DRESS

SPEC SHEET

DESCRIPTION:

The aluminium oxide, diamond blade dressing stone is a simple and effective way to bring dulled diamond blades back to life.

When a diamond blade is used on a material that is too hard for the blade's bond system, the segment will not wear and expose fresh diamonds, as it is designed to. When this happens, the exposed diamonds on the cutting edge become dull, and lose their sharp cutting edge. At this point the blade will stop cutting effectively.

Concaved Cutting Edge, for constant contact with the material, 8% Cobalt content for greater heat resistance and longer life, S-Shank fitting

MACHINE SUITABILITY:

All S-shank Reciprocating Saws, inc Makita, Bosch, Milwaukee & Dewalt

USER TIPS:

- Always wear the appropriate PPE
- Ensure that the dressing stone is secured before cutting
- Make 3 or 4 cuts through the width of the dressing stone, using your usual machine
- If you are cutting a problematic material, it is advised that you use the dressing stone periodically, and not wait for the blade to dull before re-dressing it

PART NO. DIMENSIONS

PA10001 Diamond Blade Dressing Stone

PACKAGING DETAILS:

Full Colour Carboard Sleeve.
